**CECT STUDY OF FACE AND NECK**

- A large mildly enhancing soft tissue space occupying lesion is seen in left cheek involving left buccal mucosa. Lower gingivo- buccal sulcus is involved . Retromolar trigone and upper gingivo-buccal sulcus are clear. Inferiorly the lesion extends along lower alveolus .The left masseter muscle and medial pterygoid muscle are not involved. No definite bony erosion is seen. This space occupying lesion measures 37 x 49 x 20mm in size.
- The nasopharynx and oropharynx are seen normally. No obvious mass lesion is seen. No mass lesion in seen in the parapharyngeal region.
- Bilateral submandibular and parotid glands are seen normally.
- The aryepiglottic folds and epiglottis are seen normally.
- The valleculae and pyriform sinuses are seen normally.
- The laryngeal airway and cartilages are seen normally.
- Enlarged and necrotic upper cervical lymphnodes are seen in left submandibular region, larger one measuring approx. 32 x 30mm.
- The great vessels of neck are seen normally with maintained fascial planes.
- Cervical vertebral bodies are normal in size, shape and outline and density. No evidence of any lytic or sclerotic area is seen.
- No abnormal paraspinal soft tissue shadow is seen.
- Thyroid gland is normal in size and density.

**IMPRESSION:**

- **LARGE MILDLY ENHANCING SOFT TISSUE SPACE OCCUPYING LESION IN LEFT CHEEK INVOLVING BUCCAL MUCOSA WITH INVOLKMENTS AS DESCRIBED -- MALIGNANT GROWTH.**
- **LEFT UPPER CERVICAL LYMPHADENOPATHY.**

Clinical correlation is necessary.
