MRI: CERVICAL SPINE

IMAGING SEQUENCES (NCMR)

AXIAL: T1 & T2 Wis. **SAGITTAL:** T1 & TSE T2 Wis. **CORONAL:** T2 Wis.

Cervical spinal curvature is maintained. All the visualized intervertebral discs are dessicated. Vertebral bodies are showing normal height and marrow signal intensity pattern.

Mild posterior disc bulges are seen at C4-5 and C5-6 levels causing mild indentation over thecal sac without significant compromise of lateral recess and neural foramina (AP thecal sac diameter 12.7mm and 12.6mm).

No significant disc bulge or herniation is seen at other levels. Neural foramina with exiting nerve roots at other levels are normally visualized.

Rest of the thecal sac with spinal cord is normal in signal intensity and configuration. Cord CSF interface is normally visualized. No intramedullary or intradural pathology is seen.

No evidence of any osseous or soft tissue anomaly at cranio-vertebral junction.

Pre and para-vertebral soft tissues are normal.

Screening of rest of the spine was done which reveals no significant abnormality.

IMPRESSION:

- **Mild disc bulges at C4-5 and C5-6 levels.**

Please correlate clinically.
