NCCT STUDY OF ORAL CAVITY AND NECK (AS ADVISED)

- Hypodense inter-communicating pockets of collection are seen in left side of face (along masseteric muscle), submental space & bilateral submandibular spaces with extension in midline upto just above thyroid. No evidence of extension into para-pharyngeal spaces is seen. Masticator spaces are also not involved. The volume of these pockets of collection cannot be measured (NCCT along).
- No mass lesion is seen involving oral cavity, tongue/buccal mucosa.
- The nasopharynx and oropharynx are seen normally. No obvious mass lesion is seen. No mass lesion is seen in the parapharyngeal region.
- Bilateral submandibular and parotid glands are seen normally.
- The aryepiglottic folds and epiglottis are seen normally.
- The valleculae and pyriform sinuses are seen normally.
- The laryngeal airway and cartilages are seen normally.
- Bilateral multiple subcentimeteric cervical nodes are seen involving most of groups (SAD < 10mm).
- Cervical vertebral bodies are normal in size, shape and outline and density. No evidence of any lytic or sclerotic area is seen.
- No abnormal paraspinal soft tissue shadow is seen.
- Bilateral tonsils are bulky (left > right) with tiny tonsillar calcifications.
- Both lobes of thyroid show tiny nodules (1-2mm).

IMPRESSION:

- **HYPODENSE INTER-COMMUNICATING POCKETS OF COLLECTION IN LEFT SIDE OF FACE (ALONG MASSETERIC MUSCLE), SUBMENTAL SPACE & BILATERAL SUBMANDIBULAR SPACES WITH EXTENSION IN MIDLINE UPTO JUST ABOVE THYROID - ABSCESS (?? LUDWIG'S ANGINA).**
- **BILATERAL MULTIPLE SUBCENTIMETERIC CERVICAL NODES.**
- **BULKY BILATERAL TONSILS (LEFT > RIGHT) WITH TINY CALCIFICATIONS.**
- **TINY NODULES IN BOTH LOBES OF THYROID (? GOITEROUS).**

Clinical correlation is necessary.

[DR. RAJESH KUMAR SHARMA, MD]
