

Patient Name : Mr.NAVEEN KUMAR RATHOUR	Visit No : CHA250034618
Age/Gender : 42 Y/M	Registration ON : 26/Feb/2025 10:57AM
Lab No : 10131914	Sample Collected ON : 26/Feb/2025 10:58AM
Referred By : Dr.KGMU	Sample Received ON : 27/Feb/2025 04:42PM
Refer Lab/Hosp : CHARAK NA	Report Generated ON : 28/Feb/2025 09:10AM
Doctor Advice : TB GOLD (3 metropolis tubes)	

Test Name	Result	Unit	Bio. Ref. Range	Method
-----------	--------	------	-----------------	--------

TB GOLD

Final Report	POSITIVE		NEGATIVE	
INTERFERON GAMMA IN NIL TUBE	0.50			
INTERFERON GAMMA IN ANTIGEN TUBE	2.62			
INTERFERON GAMMA TB (ANTIGEN MINUS NIL)	2.12			

INTERPRETATION

<u>NIL TUBE</u> (IU/ML)	<u>INTERFERON GAMMA TB</u> ANTIGEN MINUS NIL(IU/ML)	<u>FINAL RESULT</u>	<u>INTERPRETATION</u>
	<0.35	Negative	M.tuberculosis infection unlikely
<=8.00	>0.35 & <25% of Nil tube	Negative	M.tuberculosis infection unlikely
	>0.35 & >25% of Nil tube	Positive	M.tuberculosis infection likely
>8.00	Any result	Indeterminate	This may be due to excessive level of circulating gamma interferon or presence of heterophile antibodies

COMMENT:

A Quantiferon test is a test for latent Tuberculosis infection and helps in diagnosing M.tuberculosis complex infection including MOTT like M.kansasii, M.szulgai and M.marinum.
An indeterminate result may occur with insufficient lymphocytes or inability of the patients lymphocytes to generate IFN-γ response. This assay cannot differentiate between Latent infection and Active TB.
Magnitude of measured Gamma Interferon cannot be correlated with stage or degree of infection, level of immune responsiveness or likelihood of progression to active disease.
FALSE NEGATIVE RESULTS CAN BE THERE :
1. False negative results maybe obtained if sample is taken prior to development of immune response. CDC recommends repeat test after 8 - 10 weeks in case of high suspicion of tuberculosis.
2. Immunocompromised patients can also show false negative results.
