CT WHOLE ABDOMEN

CECT STUDY OF WHOLE ABDOMEN

- Lobulated mildly enhancing soft tissue attenuation lesion measuring approx. 28x11x25mm is seen in right supra-renal region. Right supra renal gland is not seen separately from the lesion. Few foci of calcifications are seen within the lesion. It is closely abutting adjacent parts of liver, kidney and right crus of diaphragm with maintained interface.
- Few subcentimeteric mesenteric and retroperitoneal lymph nodes are seen
- **Liver** is normal in size, and shows few tiny ill-defined hypo-enhancing lesions. The lesions appear to be most conspicuous on portal phase image and show homogenization with adjacent hepatic parenchyma on venous phase images. No intrahepatic biliary radicle dilatation is seen. Hepatic veins and IVC are seen normally.
- **Gall bladder** is contracted. No mass lesion is seen. GB walls are not thickened. (CT is not modality of choice for biliary and gall bladder calculi, USG is advised for the same).
- **CBD** is normal at porta. No obstructive lesion is seen.
- **Portal vein** Portal vein is normal at porta.
- **Pancreas** is normal in size and shows homogenous density of parenchyma. PD is not dilated. No parenchymal calcification is seen. No peripancreatic collection is seen.
- **Spleen** is normal in size and shows homogenous density of parenchyma. No SOL is seen.
- **Both Kidneys** are normal in size and position. No hydronephrosis is seen. No calculus or mass lesion is seen.
- **Both Ureters** are normal in course and caliber.
- No ascites is seen.
- **Urinary Bladder** is normal in contour with normal lumen. No calculus or mass lesion is seen. UB walls are not thickened

OPINION:

FOLLOW-UP CASE OF NEUROBLASTOMA SHOWING

- MILDLY ENHANCING LESION IN RIGHT SUPRA-RENAL REGION WITH FOCI OF CALCIFICATION AS DESCRIBED.
- HYPOENHANCING LESIONS IN LIVER - ?ARTIFACTUAL / ??NATURE. PET-CT is advisable to rule out possibility of metastases

Clinical correlation is necessary.

[DR. JAYENDRA K. ARYA, MD]
