CEMRI: PELVIS

IMAGING SEQUENCES (CEMR)

AXIAL: T1 & T2 Wis. CORONAL: T2. SAGITTAL: T1 & T2

Post Contrast : T1 sagittal, axial & coronal

Clinical profile: Follow up operated case of malignant melanoma of anal canal.

Multiple enlarged heterogenously enhancing mesorectal lymphnodes are seen, largest measuring approx 26 x 19 mm. Some of the lymphnodes are indenting posterior and right lateral walls of mid and distal rectum.

Few prominent enhancing lymphnodes are seen along bilateral internal, external and left common iliac vessels, largest measuring approx 21 x 14 mm in left common iliac region.

Subtle enhancing asymmetric T2/TIRM hyperintense thickening is seen involving right antero-lateral wall of upper part of anal canal (maximum thickness approx 3.5 mm). Cranio-caudal extent of the thickening is approx 17 mm. Inferior extent of the thickening is approx 15 mm above the anal verge. External intersphincter and intersphincteric plane appears normal.

Urinary bladder is not adequately distended.

Prostate is normal in size, outline and signal intensity pattern.

Seminal vesicles are bilaterally normally visualized.

No free fluid is seen in peritoneal cavity.

Both the hip joints are showing normal articulation and alignment.

IMPRESSION:

- **Multiple enlarged heterogenously enhancing mesorectal and iliac lymphnodes.**
- **Subtle enhancing asymmetric mural thickening involving right antero-lateral wall of upper part of anal canal -- ? nature. Histopathological correlation is suggested.**

Please correlate clinically.

**DR. RAVENDRA SINGH
MD**
