Counseling

Hypoplastic nasal bone is a soft marker for chromosomal abnormalities especially trisomy 21. This patient has not undergone aneuploidy screening so the risk cannot be estimated. Availability of screening test with >99% sensitivity for trisomy 21 ie NIPT has been explained to the couple. Amniocentesis remains to be the diagnostic test for aneuploidies. Both the options have been explained with their risks, cost & utility. The couple will decide.

Note:-- I Dr. Nisma Waheed, declare that while conducting ultrasound study of Mrs. Nidhi Srivastava, I have neither detected nor disclosed the sex of her foetus to any body in any manner. All congenital anomalies can't be excluded on ultrasound.

Clinical correlation is necessary.
