CECT STUDY OF NECK

- Right submandibular gland is bulky and shows radio opaque calculus, measuring 7.4mm at hilum of submandibular gland in proximal part of submandibular duct. Left submandibular gland is normal. No radio opaque calculus is seen.
- Bilateral tonsillar fossa calcifications are seen.
- The nasopharynx and oropharynx are seen normally. No obvious mass lesion is seen. No mass lesion is seen in the parapharyngeal region.
- Bilateral parotid glands are seen normally.
- The aryepiglottic folds and epiglottis are seen normally.
- The valleculae and pyriform sinuses are seen normally.
- The laryngeal airway and cartilages are seen normally.
- No obvious superficial or deep cervical lymphadenopathy is seen.
- The great vessels of neck are seen normally with maintained fascial planes.
- Cervical vertebral bodies are normal in size, shape and outline and density. No evidence of any lytic or sclerotic area is seen.
- No abnormal paraspinal soft tissue shadow is seen.
- Right lobe of thyroid is not seen (history of surgery). Left lobe of thyroid is normal in size and density. No space occupying lesion is seen.

IMPRESSION:

- SIALOLITHIASIS WITH SIALADENITIS RIGHT SUBMANDIBULAR GLAND.
- BILATERAL TONSILLAR FOSSA CALCIFICATIONS - SEQUELAE OF OLD TONSILLITIS.

Clinical correlation is necessary.

[DR. RAJESH KUMAR SHARMA, MD]
