CECT STUDY OF FACE & NECK

- A relatively well defined lobulated heterogeneously enhancing soft tissue attenuation lesion measuring approx. 40 x 18 x 15 mm is seen involving right inferior gingiva with contiguous involvement of right inferior gingivo buccal & gingivo labial sulci. It is causing permeative erosion of body & angle of right hemimandible including mandibular alveolus with extension across midline to involve adjacent part of left hemimandible in parasymphiseal region.
- Ill defined mildly enhancing soft tissue thickening measuring approx. 10 x 12 mm is seen in lower lip on left side.
- Few subcentimeteric bilateral cervical lymphnodes are seen at levels Ia, Ib, II & III with the largest measuring approx. 9 mm in MSAD seen at left level II.
- The nasopharynx and oropharynx are seen normally.
- Bilateral submandibular and parotid glands are seen normally.
- The aryepiglottic folds and epiglottis are seen normally.
- The valleculae and pyriform sinuses are seen normally.
- The laryngeal airway and cartilages are seen normally.
- Thyroid gland is normal in size and density.
- *Degenerative changes are seen in visualized parts of spine.*

IMPRESSION:

- HETEROGENEOUSLY ENHANCING LESION INVOLVING LOWER GINGIVA AND ALVEOLUS WITH OSTEO-EROSION, FEATURES AND EXTENSIONS AS DESCRIBED - LIKELY NEOPLASTIC.
- SUBTLE SOFT TISSUE THICKENING INVOLVING LOWER LIP ON LEFT SIDE - ? NEOPLASTIC ?? NATURE.
- CERVICAL LYMPHNODES AS DESCRIBED.

SUGGESTED : HPE CORRELATION.

Clinical correlation is necessary.

(DR. JAYENDRA KUMAR, MD)
