HIGH RESOLUTION ULTRASOUND STUDY OF CRANIUM
Study performed with 10.0MHz high frequency linear probe.

- A well defined anechoic cystic lesion measuring approx 5.9 x 4.0mm is seen along lateral wall of left lateral ventricle - likely connatal cyst.
- There is slightly increased echogenicity of bilateral supraventricular white matter - ? peri ventricular flare (in view of history of delayed cry).
- Rest of the visualized neuroparenchyma shows normal echotexture.
- Visualized part of corpus callosum & cavum septum pellucidum are normal.
- Posterior fossa could not be very well visualized.

Suggested: Follow Up with MRI Brain.

Clinical correlation is necessary.

[DR. JAYENDRA KR. ARYA, MD]

EEG EXAMINATION REPORT

- This 16 channel Sleep EEG record done under 10-20 international system of electrode placement shows organized background rhythm of 08 Hz, 40 to 80 mV in occipital leads.
- There is no significant left asymmetry.
- There is no significant right asymmetry.
- No epileptiform discharges seen.

OPINION :

NORMAL EEG RECORD.

ADVISED : CLINICAL CORRELATION.
