CECT STUDY OF FACE AND NECK

- Mildly enhancing soft tissue thickening is seen in left cheek involving left buccal mucosa and reaching upto retromolar trigone. Upper gingivo-buccal sulcus is involved. The left masseter muscle and medial pterygoid muscles are not involved. No definite bony erosion is seen. This lesion measures 22 x 21 x 7mm in size.
- The nasopharynx and oropharynx are seen normally. No obvious mass lesion is seen. No mass lesion is seen in the parapharyngeal region.
- Bilateral submandibular and parotid glands are seen normally.
- The aryepiglottic folds and epiglottis are seen normally.
- The valleculae and pyriform sinuses are seen normally.
- The laryngeal airway and cartilages are seen normally.
- Few subcentimetric upper cervical lymphnodes are seen in left submandibular and submental region [sad<10mm].
- The great vessels of neck are seen normally with maintained fascial planes.
- Cervical vertebral bodies are normal in size, shape and outline and density. No evidence of any lytic or sclerotic area is seen.
- No abnormal paraspinal soft tissue shadow is seen.
- Thyroid gland is normal in size and density.

IMPRESSION:

- **MILDLY ENHANCING SOFT TISSUE THICKENING IN LEFT CHEEK INVOLVING BUCCAL MUCOSA AS DESCRIBED -- POSSIBLE GROWTH[ADV: BIOPSY].**

Clinical correlation is necessary.

[DR. RAJESH KUMAR SHARMA, MD]
